Bite-site training: improving efficiency in large-scale network engineering

Juggling heavy workloads is something we're all familiar with. This session will illustrate how to achieve time savings using HTZ Communications. The subjects include:

Optimising coverage calculation speed using parallel computing, including:

- network model migration to station-database
- coverage predictions in remote-simulation mode (unlimited CALs)
- Benchmarking result

Network design optimisation, including:

- redundancy methodology
- analysis and reporting
- identifying sites that can be shutdown.

This session will be presented by Herve Napoletano, VP Technical Engineering, ATDI.
There will be time at the end of this session for Q&A.
